DETAILED ACTION

Status of the Claims

Claims 1 and 3-10 are pending. The following Office Action is in response to Applicant's response dated September 15, 2005. Any rejection set forth in the NON-FINAL Office Action dated June 24, 2005 not reasserted in the following Office Action is considered withdrawn. All rejections under 35 U.S.C. 102(e) have been withdrawn in view of claim amendments. However, upon further consideration, a new ground(s) of rejection is made in view of newly discovered applicable prior art. In view of the new ground(s) of rejection, the following Office Action is made NON-FINAL.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 1. Claims 1, 3-7, and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stapleton (U.S. 5,188,963) in view of Moreira ("Efficient removal of PCR inhibitors using agarose-embedded DNA preparations" Nucleic Acids Research. 1998. Vol. 26, No. 13: Pages 3309-3310).

With regard to Claims 1 and 3, Stapleton discloses methods of samples to be analyzed for the presence of a particular DNA component comprising: (a) amplifying a desired nucleic acid component in matrix material; and (b) applying an electric current to the matrix material (Column 3, Lines 20-40, for example). Stapleton further discloses the matrix as being a semi-solid material made with agarose or acrylamide or similar polymer, or mixture thereof (Column 8, Lines 40-65). Stapleton further discloses that this research clearly demonstrates amplification in agarose gels by the Polymerase Chain Reaction (PCR) with Taq polymerase (Column 12, Lines 20-35, for example). Stapleton discloses several examples (Columns 14-18; especially Example 2) wherein PCR amplification followed by electrophoretic separation is performed within a "sieving matrix" Stapleton does not specifically disclose ranges of polymer concentration.

Moreira discloses that agarose-embedded DNA can be directly used for PCR since low melting point (LMP) agarose does not interfere with the reaction (Abstract). Moreira further discloses agarose-embedded DNA is useful for PCR, since reactions are not affected by the presence of high quality LMP agarose concentrations even as high as 0.3% in the PCR mixture (Page 3309, Column 2, End Paragraph 1).

Based on the combined disclosures of the applied references, one of ordinary skill in the art at the time of invention would have had a reasonable expectation of success practicing the methods set forth by Stapleton further comprising a polymer solution comprising less than about 0.4% polymer. The motivation to do so, provided by Moreira, would have been the discovery that PCR is unaffected by low polymer

Application/Control Number: 10/659,423

Art Unit: 1637

concentration. It would have been *prima facie* obvious to one of ordinary skill in the art at the time of invention to practice the instant methods as claimed.

With regard to Claims 4 and 5, Stapleton discloses acrylamide or similar polymer, or mixture thereof (Column 8, Lines 40-65). It is noted that the Moreira reference discloses PCR in the presence of agarose only, however, Stapleton does disclose a polyacrylamide gel concentration of 5% (Column 15, Lines 5-10, for example). The demonstration of PCR in the presence of a polyacrylamide concentration of 5% would have given one of ordinary skill in the art a reasonable expectation of success practicing a PCR reaction in the presence of a *more fluidic* polyacrylamide concentration comprising less than about 0.4% polymer. It would have been *prima facie* obvious to one of ordinary skill in the art at the time of invention to practice the instant methods as claimed.

With regard to Claim 6, Stapleton discloses the matrix as being a semi-solid material made with agarose (Column 8, Lines 40-65).

With regard to Claim 7, Stapleton discloses PCR with Taq polymerase (Column 12, Lines 20-35, for example).

With regard to Claim 10, Stapleton discloses electrophoretic separation (Columns 14 and 15, Example 2, for example).

2. Claims 8 and 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stapleton (U.S. 5,188,963) in view of Moreira ("Efficient removal of PCR inhibitors using agarose-embedded DNA preparations" Nucleic Acids Research.

Application/Control Number: 10/659,423 Page 5

1998. Vol. 26, No. 13: Pages 3309-3310), in further view of Woolley et al. "Ultrahigh-speed DNA fragment separations using microfabricated capillary array electrophoresis chips" Proc. Natl. Acad. Sci. November 1994. Vol. 91: Pages 11348-11352).

With regard to Claims 8 and 9, the methods of Stapleton and Moreira have been outlined in the above rejections. Neither Stapleton nor Moreira specifically disclose methods within microfluidic channels.

Woolley et al. disclose mixing a PCR reaction component with a sieving matrix and subsequent electrophoretic separation within a microfluidic channel (Page 11349, Column 2, Electrophoresis Procedures; Figure 2, for example).

Based on the combined disclosures of the applied references, one of ordinary skill in the art at the time of invention would have had a reasonable expectation of success practicing the methods set forth by Stapleon and Moriera within a microfluidic channel. At the time of invention, the disclosure of Woolley et al. clearly would have provided the instruction necessary for one of ordinary skill in the art to practice the methods as claimed. It would have been *prima facie* obvious to one of ordinary skill in the art at the time of invention to practice the instant methods as claimed.

Conclusion

No claims are allowed. No claims are free of the prior art.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Christopher M. Babic whose telephone number is 571-272-8507. The examiner can normally be reached on Monday-Friday 7:00AM to 4:00PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gary Benzion can be reached on 571-272-0782. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
